感謝，有發現問題了，主要是HID Descriptor 的問題

您附上的文件，表示hookswitch 是必需的，之前應該是在這邊沒有處理好，我將Keyborad 的HID Descriptor換成這份文件的5.2.4裡的Descriptor，電腦就任的出HID裝置了

不過現在還面臨一個問題，就是要怎麼發送Telephony的report，直接用keyboard 發送report的code看起來是不相容，這部分還要再研究看看

#### 5.2.4 HID Report Descriptor

As is customary for HID report descriptors, the contents of the report descriptor are described here in a readable notation that can be readily assembled into binary form.

The following example is for a simple phone with the following features:

&#8226; A hookswitch for the handset. (This is mandatory.)

&#8226; A standard telephone keypad. (This is optional.)

&#8226; A volume control. (This is optional.)
