我剛得到同事的回覆如下:

Please client kindly have a look at USB3751 datasheet again.

- Dead Battery Provision Support (USB375x-1 only)
 - Allows 100 mA trickle charging from VBUS when attached to a Standard Downstream Port (SDP) while not enumerated
 - Built-in 100mA current limiting option

To support the device dead battery conditions as defined in the USB Battery Charging Specification, Revision 1.2, the USB375x-1 has the ability to drive V_{DAT_SRC} on DP which allows a device with a dead battery to draw 100mA from a USB host. This will allow a device to charge a dead battery without violating the USB specifications. The USB375x-1 also includes a current limit to prevent the unconfigured current from exceeding 100mA. Note, this feature is not available with the USB375x-2.
